It is imperative that you identify the type of spray pattern that will be released from the canister; failure to identify this can lead to improper applications and undesired results. To confirm the product's spray pattern, simply check the label and a property icon (like the one pictured left and listed below) will indicate this.

**IMPORTANT**
ALWAYS CHECK WHAT TYPE OF SPRAY PATTERN YOUR ADHESIVE HAS BEFORE SPRAYING.

### TYPES OF SPRAY PATTERN

**WEB SPRAY**
The easiest visual comparison that can be made to a Web spray is that of a spider's web, hence the name!

**MIST SPRAY**
Mist spray adhesives are released from the container as a fine mist, which creates a light and consistent droplet pattern on the surface it is sprayed upon.

**PEBBLE SPRAY**
Pebble sprays are similar to Mist sprays however the pattern is made up of larger droplets, but still giving a smooth and consistent pattern on the surface.

**SNOWFLAKE SPRAY**
Snowflake spray adhesives have a high build, large flake spray pattern which resemble snowflakes across the surface for single-sided bonds.

### SETUP

**STEP 1.**
Screw the larger hose nut to the gun thread (clockwise) and fully tighten with a spanner. Check hose is securely attached.

**STEP 2.**
Screw the smaller hose nut to the canister valve (clockwise) and fully tighten with a spanner. Check the hose is securely attached.

**STEP 3.**
Turn the canister valve anti-clockwise until fully open. Check connections for leaks - if any occur, tighten connections. DO NOT TURN THE CANISTER VALVE OFF UNTIL THE CANISTER IS EMPTY (this is to prevent adhesive curing in the hose and gun).

**STEP 4.**
On initial use, or if canister has been standing for over 12 hrs, the hose and gun may require a purge. Pull the trigger and adjust flow by turning adjustment screw at the back of the gun (anticlockwise to open and clockwise to close). Dispense and discard adhesive until a consistent spray pattern is achieved.
STEP 1.
Prepare the surface to be bonded; ensuring both faces are clean, free of dust, dirt and grease. If necessary wipe clean with proprietary solvent-based cleaner. DO NOT USE WHITE SPIRIT, METHYLATED SPIRITS OR CITRUS-BASED CLEANERS.

STEP 2.
Hold spray gun at a constant distance of between 100-250mm (4” - 10”) from the surface, allowing the adhesive to web across the surface with approximately 50-70% overlap to successive passes for thin laminates to reduce risk of telegraphing (note — correct coat weight must be achieved).

STEP 3.
Maintain a constant speed of application during spraying, applying a consistent and thorough coating without allowing the adhesive to puddle or heavily ‘wet’ the surface. Maximum bond strength is achieved with coverage of between 80-100%, and a recommended minimum coat weight of 20 dry grams per m\(^2\).

STEP 4.
Maximum adhesion will be obtained by spraying mating faces at 90° to each other, i.e. one face vertically, the other face horizontally. Double coating perimeter of face and edges is recommended, including areas around subsequent cutting positions.

- Do not angle spray gun or move in an arc while spraying. Hold gun at 90° to surface while spraying. Release trigger at end of each pass to optimize coverage.
- Many man-made boards such as plywood and especially flexi-ply and MDF are very absorbent and will need a primer coat (shown in ‘COVERAGE TOO LIGHT’ picture). Allow to dry, then apply the normal ‘CORRECT APPLICATION’, as shown, over top of primer coat.
- Many substrates should be regarded as difficult to bond, e.g. metal faced HPL, Colorcore etc. or products with memory (also soft and thick materials may require 2nd or 3rd coat). Best results are obtained by multiple coats rather than one heavy coat which may result in heavy wetting of surface and extended drying times. Always test before using in production – see disclaimer.
- Allow adhesive to dry (see product data sheets for appropriate drying times). Test for dryness using back of hand only; surface should be tacky but adhesive should not transfer to skin. Position substrates correctly and press together working from centre outwards. Apply adequate pressure using nip roller or 75mm hand roller and body weight as a minimum in order to achieve at least 35psi at glue line. Note; repositioning is not possible after contact has been made.
- Immediate trimming/routing is possible. Full strength is achieved after 24-48 hours depending on temperature and humidity.
MIST/PEBBLE SPRAY APPLICATION
**STEP 1.**
Prepare the surface to be bonded; ensuring both faces are clean, free of dust, dirt and grease. If necessary, wipe clean with proprietary solvent-based cleaner. DO NOT USE WHITE SPIRIT, METHYLATED SPIRITS OR CITRUS-BASED CLEANERS.

**STEP 2.**
Hold spray gun at a constant distance of between 200-400mm from the surface, allowing the adhesive to droplet across the surface with approximately 50-70% overlap to successive passes for thin laminates to reduce risk of telegraphing (note — correct coat weight must be achieved).

**STEP 3.**
Maintain a constant speed of application during spraying, applying a consistent and thorough coating without allowing the adhesive to puddle or heavily ‘wet’ the surface. Maximum bond strength is achieved with coverage of between 80-100%, and a recommended minimum coat weight of 20 dry grams/m².

**STEP 4.**
Maximum adhesion will be obtained by spraying mating faces at 90° to each other, i.e. one face vertically, the other face horizontally. Double coating perimeter of face and edges is recommended, including areas around subsequent cutting positions.

- Do not angle spray gun or move in an arc while spraying. Hold gun at 45° to surface while spraying. Release trigger at end of each pass to optimize coverage.
- Many man-made boards such as plywood and especially flexi-ply and MDF are very absorbent and will need a primer coat (shown in ‘COVERAGE TOO LIGHT’ picture). Allow to dry, then apply the normal ‘CORRECT APPLICATION’, as shown, over top of primer coat.
- Many substrates should be regarded as difficult to bond, e.g. metal faced HPL, Colorcore etc. or products with memory (also soft and thick materials may require 2nd or 3rd coat). Best results are obtained by multiple coats rather than one heavy coat which may result in heavy wetting of surface and extended drying times. Always test before using in production – see disclaimer.
- Allow adhesive to dry (see product data sheets for appropriate drying times). Test for dryness using back of hand only; surface should be dry and adhesive should not transfer to skin. Position substrates correctly and press together working from centre outwards. Apply adequate pressure using nip roller or 75mm hand roller and body weight as a minimum in order to achieve at least 35psi at glue line. Note; repositioning is not possible after contact has been made.
- Immediate trimming/routing is possible. Full strength is achieved after 24-48 hours depending on temperature and humidity.
**CANISTER CHANGEOVER**

**STEP 1.**
Lay the empty canister on its side with the valve pointing AWAY from the operator, and well away from sources of ignition.

**STEP 2.**
Open the canister valve (anti-clockwise) and release any residual pressure.

**STEP 3.**
Stand canister upright. Use a hammer and brass punch or other non-sparking instrument to puncture the friable disc.

**STEP 4.**
As long as the user is able to accept responsibility for de-pressurising the canister, it can be disposed of as per your normal scrap metal disposal (subject to local waste restrictions).

**TRANSPORT INFORMATION**
- During transport, the recommended PPE (Refer to MSDS), First Aid Kit and suitable Fire Extinguisher should be readily accessible in the vehicle.
- Keep vehicle well ventilated at all times whilst it contains spray contact adhesive.
- Secure canister during transportation.

**IMPORTANT NOTE:** This process should be followed through immediately and adhesive should be dispensed from the new can or the gun and hose will block and become unusable.

**IMPORTANT:** SAFETY GLASSES AND GLOVES MUST BE PUT ON BEFORE STARTING THE DISPOSAL PROCESS.

**STEP 1.**
Turn the canister valve clockwise until fully closed. Pull the trigger on the gun and hold for 10 seconds to expel residual pressure.

**STEP 2.**
Unscrew the hose nut and disconnect the hose from the empty canister (move to next page for canister disposal).

**STEP 3.**
Connect the hose and gun to the new canister (go to Step 2 of PREPARATION and follow the process through to Step 4).

If you are not transferring the hose and gun to a new canister you will need to clean it to ensure it can be used again on future jobs.

**IMPORTANT:** SAFETY GLASSES AND GLOVES MUST BE PUT ON BEFORE STARTING THE DISPOSAL PROCESS.

**STEP 1.**
Lay the empty canister on its side with the valve pointing AWAY from the operator, and well away from sources of ignition.

**STEP 2.**
Open the canister valve (anti-clockwise) and release any residual pressure.

**STEP 3.**
Stand canister upright. Use a hammer and brass punch or other non-sparking instrument to puncture the friable disc.

**STEP 4.**
As long as the user is able to accept responsibility for de-pressurising the canister, it can be disposed of as per your normal scrap metal disposal (subject to local waste restrictions).
Our series of SUBSTRATE and PROPERTY icons have been designed to make identifying our products as simple as possible.
If you are having trouble with one of our products or if you require any further information, please don’t hesitate to get in touch.
